

Objective:

To investigate whether SSP could contribute to the high rates of symptom recurrence shortly after antipsychotic treatment discontinuation by comparing the nature of relapse events that occur soon after treatment discontinuation with those that occur later, as well as with previous psychotic episodes.

Methods Used:

No analyses were conducted. No data were accessed. We were unable to conduct this study because you were not willing to allow us to download the data which we needed to combine with another dataset.

Results: None

Conclusions: N/A
