

Consistency checks to improve measurement with the Cohen Mansfield Agitation Inventory (CMAI)

1. Objective: Apply expert developed rating consistency flags to assessments derived from clinical trials to help understand how often various potential scoring inconsistencies occur.
2. Methods Used: We applied a draft set of consistency flags to these datasets in keeping with the original proposal. We are waiting to complete the planned analysis by contextualizing this data with applying flags to additional data sets.
3. Results: Flags appeared in ratings, further data sets are needed to contextualize and examine further.
4. Conclusions: N/A
