Project Summary Report

#2022-5008

Analytical Approaches of Time to Event of Patient-reported Outcomes: A Case Study in Patients with Metastatic Castration-resistant Prostate Cancer

Objective
To provide context to the decision points needed to develop an estimate and related sensitivity analyses when analyzing PRO data using TTE methods, and to illustrate this with a concrete example from a trial of chemotherapy-naive metastatic castration-resistant prostate cancer (JNJ-56021927)

Methods Used
No analyses were conducted on the data provided, as it was too time intensive for the SAS-savvy research team to learn R.
